## OBJECTIVES:

Advancements in molecular biology have stimulated a great impact on all life sciences investigation to improve the trends in global biodiversity condition. This dynamic force involves the development of highly sophisticated experimental methods in molecular biology with broad interdisciplinary applications, the quickly expanding information flow of scientific discoveries and technical novelties across scientific community, and the development of precise computational tools with constantly updated biological databases for, respectively, analyzing gene expression level, cytogenetic profile, storing data for genotypes, and other molecular features. This has transformed the approach of scientific research allowing revolutionized discoveries in the area of molecular biology. Advances in high-throughput tools, recombinant technology, and NGS made it feasible to unveil genome complexity and to explain the detailed mechanisms for transmission of genetic information. Moreover disease analysis, treatment, and prevention; manipulation of animals and plants for improved phenotypic traits; and synthesis of new peptides and proteins are some of the applications of molecular biology that are frequently being adopted.

There are several approaches from which knowledge in the field of molecular biology is increasingly growing, and it could be challenging for researchers coming into life sciences field. Accordingly there is a need for a platform for preparing molecular biologists to keep themselves abreast of modern trends in molecular biology. Thus, this book series, **Modern Trends in Molecular Biology**, includes the most of the dynamic pieces of research work being done across the globe on numerous themes associated with molecular biology. This book series attempts to enlighten readers regarding novel concepts and findings in the molecular biology field. The scope of this book series includes recent findings and advancements in the areas of transcriptomics, proteomics, genomics, micro RNA, molecular markers, DNA, RNA and protein isolation, CRISPR, gene editing molecular methods, gene cloning, construction of genome and cDNA library, DNA methylation role for gene expression analysis, AFLP, RAPD, RFLP, VNTRs, genome sequencing tools, phylogenetic analyses, protein modeling, restriction enzymes, metagenomics, metatranscriptomics, metaproteomics, DNA repair, replication and recombination, DNA forensics, pharmacogenomics function genomics, structural genomics, and computational analyses for proteins and genes.

This webinar touches much variety of topics covering modern aspects of molecular biology, with the goal of helping to keep researchers, scientists, and students abreast of recent advances in the field. Topics will include:

- Molecular Biology: Fundamentals and Applications
- Molecular Parasitology

- Molecular Entomology
- Molecular Virology
- Molecular Phycology
- Molecular Ecology
- Molecular Nematology
- Molecular Physiology
- Molecular Epidemiology
- Molecular Breeding
- Molecular Agriculture
- Molecular Aquaculture
- Molecular Pathology
- Molecular Medicine
- Molecular Genetics
- Molecular Markers
- Molecular Diagnostics
- Molecular Evolution
- Molecular Immunology
- Molecular Microbiology
- Molecular Pharmacology
- Molecular Biodiversity
- Molecular Enzymology
- Molecular Phylogenetics

**Duration of the Webinar** – 3 Hours (from 11.00 Am to 2.30 PM)

**Eligibility:**

## Co-suppression: Exogenous gene suppress homologous endogenous genes

- ❖ 1990 Richard Jorgensen and his group discovered gene silencing while working with petunias.
- ❖ Petunias developed areas of hypopigmentation when transduced with the gene encoding an enzyme required for pigment synthesis.
- ❖ –The phenomena was called **Co-suppression**
- ❖ –Similar effects seen in fungi. called “**Quelling**”

**poly-(ADP ribose)-polymerase (PARP)**

- Abiotic stress tolerant plants (by CSIRO & Bayer CropScience) by downregulation of poly-(ADP ribose)-polymerase (PARP) – 25-40% increased yields in *Arabidopsis*, *oilseed rape* and *corn plants* .
- It is known that in animals and humans, enzymes which metabolize polymers of ADP-ribose become up-regulated under stress conditions.
- These enzymes which are called 'poly-(ADP ribose)-polymerase (PARP) also exist in plants.
- Over-activation of these and related genes in animals cause a rapid breakdown of the substrate NAD+.
- This re-synthesis of NAD+ requires energy in form of ATP. Therefore, the over-activation of PARP genes under stress conditions results in depletion of biological energy and thereby in loss of vigor and fitness.
