

35. Waste Management

Solid Waste management: Solid waste and garbage is collected from time to time and put in pits. As far as possible, it is covered with soil so that it is not spread in the campus. Compost pit is available in the campus in front of the Botany Lab. Bio-fertilisers are made through Vermi-composting.

Liquid waste Management: Liquid waste generated in the campus is drained out through pipes. Sewage water is collected in the septic tanks. Water generated in activities like hand washing etc is used for plants.

E-Waste management: E-waste is being identified for better management.
