

Degradable and nondegradable waste 17 Management.

At college we are collecting waste material in to two different collection dustbins. One is for wet and another is for dry waste. Wet waste comprises food remains, plant debris, garden waste, fruits, flowers and small paper pieces. This waste is capable of undergoing anaerobic and aerobic decomposition. So these wastes are transferred to Compostpit which is maintained in college.

These organic wet waste transformed in to simpler units and then we use them as compost manures. Therefore Compostpit makes them Ecofriendly.

Paper, cardboard, Plastic were separated as dry waste. They were again separated as plastic and non plastic waste and sold to the Scrap collector for further recycling process.
