Transfer Credits:

For college students who want to attend summer classes, but live too far from their colleges and/or work summer jobs, taking online classes from an accredited college and transferring the credits to their primary college can be beneficial. Students can earn college credit while still enjoying their summer vacation or fulfilling the responsibilities of their seasonal employment. Similarly, if a college or university does not offer enough open sections of a required course, students can take the course online at another college and transfer the credits.

Students in online programs can effectively manage their time, learn the materials, and complete assignments on their own schedules to name just a few benefits of online learning.

- IIT Bombay Has Entered MOU With Government of Telangana State and Offered Online Training Program to Enhance The Student Ability In Various Courses Like C, C++, Java, My Sql, Libre Office and Php, for both UG and PG Students.
- As per the instruction of IIT Bombay, We successfully registered students, conducted trainings then students received online certificates by passing the online examination conducted by IIT Bombay.

1	Module-1	Hydroponics and Green fodder: Definition, Nutritional value of green fodder, Importance of Hydroponic green fodder, types of Hydroponic fodder.
2	Module-2	Production of Hydroponic fodder from maize, horse gram, sunhemp and jowar.

Introduction:

Green fodder is considered as the natural diet for livestock. Its production to meet the current demand has become a challenging task among livestock farmers. Due to several reasons, green fodder production has been facing crisis and so the livestock productivity. Due to increasing intensive system of rearing livestock, the need for green fodder is enormous. As the gap between the demand and supply of the green fodder for livestock becoming unconquerable, researchers and farmers are in search for an alternative fodder or fodder production method, that would restore fodder and livestock production.

Hydroponics technology has revolutionized the green fodder production in the 21st century. Hydroponics is a method of growing green fodder without soil in an environmentally controlled houses or machines. Many of the livestock farmers are switching to hydroponic fodder production from conventional production methods, as the fodder produced by this method are highly nutritious, provide sustainable fodder production round the year and conserve water.

Module-1 (4 hours)

Hydroponics and Green Fodder:

The word hydroponics has been derived from the Greek word 'water working'. Hydro means 'water' and ponics means 'working' and it is a technology of growing plants without soil, but in water or nutrient rich solution for a short duration in an environmentally controlled houses or machine.

"Fodder" refers particularly to food given to the animals (including plants cut and carried to them), rather than that which they forage for themselves in pasture and grazing land. It includes hay, straw, silage, compressed and pelleted feeds, oils and mixed rations, and also sprouted grains and legumes.

Hydroponic green fodder means "Fodder grown using hydroponics technology".

Nutritional value of Green fodder

1. Natural diet for animals.
2. Improves fat and protein percentage in milk.
3. Rich in beta carotene and minerals that help in the synthesis of vitamin A.
4. Vitamin A has greater impact on reproduction.

Importance of Hydroponic green fodder

Saves water

Consumes 98% less water than conventional method and the used water is recycled.

Reduced growth time

It takes only 8 days duration to develop from seed to fodder while it took 45 days for a conventional fodder to grow. Enhanced nutritive value – as the fodder contains the seed along with the fodder, it has higher crude protein content than conventional green fodder.

Marginal land usage

Up to 1000 kg green fodder can be produced from 480 square feet area daily which is equivalent to conventional fodder (Co4) produced in 25 acres of cultivable land. Use 99% less land than conventional production method.

Constant supply

Fodder can be produced round the year irrespective of the failure of monsoon, land availability, natural calamities, labour shortage. It promotes sustainable agriculture and livestock production.

Requires minimal man power and time

Only 2 -3 hours of work daily, doesn't involve technical work. Farmer can do the work without difficulty.

Completely natural and organic

Fodder is grown completely natural without the use of any pesticides.

Optimal production cost

Production cost is optimal when compared to conventional fodder production.

Cost of production is 2.50 INR / kg of hydroponic maize fodder.

Hydroponic machine (1000 kg capacity) consumes only 40 units of current per day.

Reduce feed cost

As the fodder contains more crude protein compared to conventional fodder it reduces the feed cost spent on the concentrate feed to half.

Minimal equipment usage

Reduce the need for equipment and fuel used to plant, grow, harvest, transport, and store feed.

Nutritious fodder

Hydroponic fodder along with seed and root (sprout mat) are highly edible and are rich in protein (10 – 17%). Ideal nutrients enriched fodder for livestock.

Types of Hydroponic fodder

Yellow Maize, Cowpea, Horse gram, Sun hemp, Ragi, Bajra, Foxtail millet and Jowar has been grown successfully given good response from the livestock as a fodder.

Module-2 (26 hours)

Production of Hydroponic fodder from maize, horse gram, sunhemp and jowar

Protocol for fodder production

1. Seed storage and preparation

Dry the seeds under direct sunlight one day prior to seed washing.

Remove broken seeds and dirt's from the seeds.

Store seeds in a dry and safe place.

2. Seed washing

Take good quality seeds in a washing chamber.

Add water.

Wash the seeds with proper scrubbing by hand.

Keep for settling for 5 minutes.

Remove the light weight floating seeds.

Drain out water and again add water.

Stir manually by wooden stick for 5 minutes, keep settling for 5 minutes.

Drain water.

Repeat the above steps till, dirt and dead seeds are removed completely.

3. Seed cleaning

Prepare 0.1% cleaning solution in a plastic chamber.

Add washed seeds to this 0.1% cleaning solution.

Stir manually by wooden stick for about 5 minutes.

Keep for 1 hour.

Drain the cleaning solution.

4. Seed soaking

Prepare stimulant Solution in the soaking chamber as per quantity given.

Add seeds from the above steps to the soaking chamber.

Close the lid and keep for soaking for number of hours for the given seeds.

After soaking for the given hours, drain the stimulant solution.

5. Seed germination

Cover/ place the "After soaking seeds" with the clean dry fumigated gunny bag.
Keep the seeds loaded gunny bags away from direct sunlight.
Keep the lid open & keep for germination for number of hours.
Sprinkle water on gunny bag every 2-3 hours so that the gunny bag remains wet.
After given hours, remove the seeds from gunny bag take weight.
About 35 to 40% increase in weight happen with about 90+% seed germination.

6. Loading seeds in trays and racking

Ensure that the trays are clean, washed with cleaning solution & free from dust
Transfer "after germination seeds" on the trays equally and put them in the sprout
Section (lower section where the height between two rows is around 5 inches) of
machine
Trays should be distributed evenly on both sides of the alley.

7. Shifting of trays

Shift trays to next level daily so that it moves one step ahead in the growth cycle.
Take the last tray out from every row and put it back on the front side of the same
row.
Ensure that all trays are moved one position every day
Ensure that all trays receive sufficient water.
If left side of the tray (in any tray) shows more growth then the right side (or vice-
versa) then rotates the tray such that left side comes to the right side and right
side of the tray goes to the left side.

8. Harvesting

Trays on the 8th day rack are ready for harvest on the next day.
Take out of the fodder mat from trays to feed livestock.
Wash the trays in clean water and then in cleaning solution before reusing it for
the next cycle.
