### **Introduction**

Mushrooms are being used as food and medicine from ancient times. Mushroom contains all essential amino acids, vitamin B complex, iron, calcium, potassium, phosphorous, folic acid and other biochemical compounds. It is also a good source of dietary fibre. It is regarded as highly edible even for people suffering from cholesterol problems, heart diseases, diabetes and cancer. Mushroom cultivation has now become a source for income generation since there is a large demand for healthy and quality food products. Many value added products are also obtained from mushrooms. The cultivation procedure is characterised by small initial investment and year round production. It is an eco-friendly agricultural practice. Considering the commercial viability and self-employment potential of mushroom cultivation and marketing, the Department is offering the same as an add on certificate course to the under graduate students of the College.

### **Aims of the Course**

- To enable the students to identify the edible and poisonous mushrooms.
- To provide hands-on training for the preparation of bed for mushroom cultivation and its harvesting, pests and diseases control and post harvesting management.
- To provide the students awareness about the marketing trends of Mushrooms.
- To give the students exposure to the experiences of experts in the field and to functioning mushroom farms.
- To help the students to learn a means of self-employment and income generation.

Duration of Course: The course shall extend over a period of three months (40hrs).

Production of Green fodder by Hydroponic Technology

Resource person  
G. Raghu  
Assistant professor of Biotechnology & Incharge

## **Introduction:**

Green fodder is considered as the natural diet for livestock. Its production to meet the current demand has become a challenging task among livestock farmers. Due to several reasons, green fodder production has been facing crisis and so the livestock productivity. Due to increasing intensive system of rearing livestock, the need for green fodder is enormous. As the gap between the demand and supply of the green fodder for livestock becoming unconquerable, researchers and farmers are in search for an alternative fodder or fodder production method, that would restore fodder and livestock production.

Hydroponics technology has revolutionized the green fodder production in the 21st century. Hydroponics is a method of growing green fodder without soil in an environmentally controlled houses or machines. Many of the livestock farmers are switching to hydroponic fodder production from conventional production methods, as the fodder produced by this method are highly nutritious, provide sustainable fodder production round the year and conserve water.

## **Module-1 (4 hours)**

### **Hydroponics and Green Fodder:**

The word hydroponics has been derived from the Greek word 'water working'. Hydro means 'water' and ponics means 'working' and it is a technology of growing plants without soil, but in water or nutrient rich solution for a short duration in an environmentally controlled houses or machine.

"Fodder" refers particularly to food given to the animals (including plants cut and carried to them), rather than that which they forage for themselves in pasture and grazing land. It includes hay, straw, silage, compressed and pelleted feeds, oils and mixed rations, and also sprouted grains and legumes.

Hydroponic green fodder means "Fodder grown using hydroponics technology".

### **Nutritional value of Green fodder**

1. Natural diet for animals.
2. Improves fat and protein percentage in milk.
3. Rich in beta carotene and minerals that help in the synthesis of vitamin A.
4. Vitamin A has greater impact on reproduction.

## **Importance of Hydroponic green fodder**

### **Saves water**

Consumes 98% less water than conventional method and the used water is recycled.

### **Reduced growth time**

It takes only 8 days duration to develop from seed to fodder while it took 45 days for a conventional fodder to grow. Enhanced nutritive value – as the fodder contains the seed along with the fodder, it has higher crude protein content than conventional green fodder.

### **Marginal land usage**

Up to 1000 kg green fodder can be produced from 480 square feet area daily which is equivalent to conventional fodder (Co4) produced in 25 acres of cultivable land. Use 99% less land than conventional production method.

### **Constant supply**

Fodder can be produced round the year irrespective of the failure of monsoon, land availability, natural calamities, labour shortage. It promotes sustainable agriculture and livestock production.

### **Requires minimal man power and time**

Only 2-3 hours of work daily, doesn't involve technical work. Farmer can do the work without difficulty.

### **Completely natural and organic**

Fodder is grown completely natural without the use of any pesticides.

### **Optimal production cost**

Production cost is optimal when compared to conventional fodder production.

Cost of production is 2.50 INR / kg of hydroponic maize fodder.

Hydroponic machine (1000 kg capacity) consumes only 40 units of current per day.

### **Reduce feed cost**

As the fodder contains more crude protein compared to conventional fodder it reduces the feed cost spent on the concentrate feed to half.

### **Minimal equipment usage**

Reduce the need for equipment and fuel used to plant, grow, harvest, transport, and store feed.

### **Nutritious fodder**

Hydroponic fodder along with seed and root (sprout mat) are highly edible and are rich in protein (10 – 17%). Ideal nutrients enriched fodder for livestock.

## Types of Hydroponic fodder

Yellow Maize, Cowpea, Horse gram, Sun hemp, Ragi, Bajra, Foxtail millet and Jowar has been grown successfully given good response from the livestock as a fodder.
