## Abstract

This paper deals with vibrations in a plane angular sector (PAS) of double porosity isotropic solids of elliptic cone shape. The frequency equation is obtained in the frame work of isotropic double porosity solids. This extended frame work was based on Biot's theory of isotropic single poroelastic solids. For illustration purpose, two materials namely, Berea sandstone saturated with kerosene and Berea sandstone saturated with water are used. The non-dimensionalisation of single porosity isotropic solids is extended here to double porosity isotropic solids. Non-dimensional phase velocity as a function of non-dimensional wavenumber is computed for various corner angles of PAS.

## Abstract

G-type waves in an initially stressed poroelastic semi-infinite solid consists of a layer lying on a half space are investigated in the framework of Biot's theory of isotropic poroelasticity with some variants. Dispersion equation is obtained on solving the resultant Hill's differential equation with the aid of Laplace transform by the Valeev's method. Numerical examples for phase velocity, group velocity, angular frequency, and attenuation are presented graphically as a function of wavenumber for various values of viscosity, initial stress, and heterogeneity parameter. Some particular cases are discussed.

## Abstract

In this paper, SH-wave propagation in an initially stressed trilinear layer welded between two half-spaces is investigated. The upper half-space is considered to be transversely isotropic and elastic, while the lower one is heterogeneous, isotropic, and poroelastic. In the case of the lower half-space, the problem is reduced to the Whittaker differential equation. Frequency equations are derived for the layer as a whole and half-spaces. It is found that the phase velocity is strongly influenced by the initial stress, porosity, and heterogeneity.
